

Unit 6 Overview

Ratio, Proportion, and Percent

IN UNIT 6 students begin by working with ratios and use multiplication tables to find equivalent ratios. They do activities using Multiplication Table Puzzles to help build the link between multiplication and equivalent ratios. They learn to distinguish between non-proportion situations and problems that can be modeled and solved by using ratio and proportion. Finally, they are introduced to the meaning of percent and the use of percents to describe probabilities. Students have opportunities to apply their understanding to real-world, problem-solving situations.
