

Nervous System

Cerebrum and Cerebellum The cerebellum is the part of your brain that makes your movements smooth and controls balance. The cerebrum is the part of the brain that controls most thinking. Notice the deep folds that give more area for storing information.

Spinal Cord The spinal cord has a membrane around it. This membrane protects the spinal cord. The spinal cord carries messages to and from the brain. The backbone protects the spinal cord.

Nerve Nerves are long and thin and carry information from one place to another in the body. The small purple dots are the nuclei of nerve cells.
